Superfund Green Gold SICAV

SUPERFUND GREEN GOLD SICAV ENDED THE MONTH OF JANUARY WITH A PERFORMANCE OF -1.76 %

Superfund Green predominantly employs medium- to long-term trend following strategies and trades in approximately 150 liquid financial and commodity markets around the world. For further diversification, Superfund Green also utilizes short-term strategies, such as forecast models, counter trend, and short-term trend following. This managed futures strategy aims to achieve absolute returns in the long run in both falling and rising markets. The Superfund Green managed futures strategy has been utilized successfully in the long term since March 1996 and is based on proprietary, fully automated trading systems, which effectively eliminate human emotion. Overall risk is permanently screened and each trading position is continuously adjusted according to market volatility. Due to its low correlation to other asset classes in the long term, Superfund Green can be a valuable addition to every portfolio. Superfund Green Gold ties the proven managed futures strategy of Superfund Green with the value of gold (price of gold). Thus, investors benefit from the potential performance of both the Superfund Green strategy and the price of gold (denomination in gold). Thereby, Superfund Green added the gold standard into the financial world.

Performance results shown in this document are net of fees. This fund is denominated in USD and therefore causes an additional currency risk, i.e. the net performance may rise or fall due to currency fluctuations. Past performance is not indicative of future results. Superfund-products are speculative investments. A complete loss of the principal invested cannot be excluded. This publication constitutes neither an offer to sell nor a solicitation to invest. Such offer or solicitation will be made only in those jurisdictions where permitted by law and will be preceded or accompanied by a current prospectus and such other documents as may be required, such as the latest audited financial statements and audit report. In addition to the respective performance statistics of the respective Superfund Strategy, the performance of the price of gold in USD has a direct influence on the value of these gold share classes because the current value of the respective share class portfolios are additionally hedged through financial instruments whose values rise and fall along with the rise and fall of the USD price of gold. This means that if the fund assets are completely hedged into gold, then a 1% rise in the USD price of gold would lead to an additional 1% gain in the net asset value of the gold share classes. Conversely, a 5% drop in the USD price of gold would cause a decline in the net asset value of the gold share classes. A DROP IN THE PRICE OF GOLD WILL RESULT IN A REDUCTION IN THE NET ASSET VALUE OF THE GOLD SHARE CLASSES. The author and distributors of this material expressly disclaim any and all liability for any inaccuracies contained in this document, and shall not be held liable for the same.
